## Colourful coral reef

**Coral reef** started forming 12,000 years ago little by little. The colours of corals vary: those living in **shallows** waters have bright colours while those living in deeper waters are usually darker. The world's biggest coral reef is the Great Barrier Reef in South Australia. It is home to many marine animals!

## Clever clownfish

In *Finding Nemo*, Nemo is a clownfish! They all look **adorable** with their orange and white stripes. They hide near a **sea anemone** (this sea creature does not eat clownfish because this fish has a protective layer).

## Delicate dragon

Wow! Isn't it beautiful? Leafy sea dragons are very **delicate**. They live among seaweed. **Predators** find it difficult to spot them because they have fins that look like seaweed. When they move, they look like seaweed drifting in the water!

Ling

Wow! It takes such a long time to form a coral reef!

Yes! We have to take care of it or it will soon be gone!

So, what other animals live here?
